

Brief Note

Tools Used

- **Microsoft Excel** was used for data cleaning and preparation, including splitting combined fields, checking for missing values, formatting IDs, and standardizing categorical data.
- **Power BI** was used for data visualization to create interactive charts and dashboards that supported analysis and interpretation of key trends.
- **Microsoft Power Point** was used to create presentation slides.

Technical requirements

If the presentation will be online, can we please not use Microsoft teams, I tend to have network issues whenever I'm using it especially if I turn my camera on.
